

FAWA-WR MISSION VOYAGER (KAI)

CANINE / VIZSLA

Date of Birth: 5/14/2008 Sex: F Weight: 44 lbs. Age: 31 mo.

 Reg. #: SR50549002 Owner Copy

Microchip: 4A3567044D

Tattoo:

RESULTS

LEFT	Distraction Index (DI)	0.32	DI is greater than 0.30 with no radiographic evidence of DJD. There is an increasing risk of developing DJD as the DI increases; low risk when DI is close to 0.30, high risk when DI is close to 0.70 or above.
	Degenerative Joint Disease (DJD)	None	
	Cavitation	No	
	Other Findings	Not Applicable	

 Reference #: **891282**
 Practice #: XRAY#7251

Radiography Date: 12/11/2010

Date Received: 12/8/2010

Owner:
 RHODA EZELL

ANIMAL

RIGHT	(DJD)	None	
	Cavitation	No	
	Other Findings	Not Applicable	
T	Distraction Index (DI)	0.27	DI is less than or equal to 0.30, with no radiographic evidence of DJD.
	Degenerative Joint Disease	None	

The chart above indicates the ranking of your animal's passive hip laxity (DI) in relation to all CANINE animals of the VIZSLA breed in our database. This result means that 1) your animal's hips are tighter than approximately 80% of this group of animals (alternatively, 20% of the group has tighter hips than your animal), and 2) your animal's hip laxity is in the tighter half of the laxity profile. Breed-specific evaluations are analyzed semi-annually. Consequently, the average laxity and range of laxity for any given group will change over time.

PennHIP does not make specific breeding recommendations. Selection of sire and dam for mating is the decision of the breeder.
NOTE: As a minimum breeding criterion, we propose that breeding stock be selected from the population of animals having hip laxity in the tighter half of the breed (to the left of the median mark on the graph). Higher selection pressure equates to more rapid expected genetic change per generation.

By implementing selection based on passive hip laxity, we expect the breed average DI over the years to move toward tighter hip configuration, meaning lower hip dysplasia susceptibility. The PennHIP database permits scientific adjustment of criteria to reflect these

Please note that the PennHIP DI is a measure of hip joint laxity, it does not allude to a "passing" or "failing" hip score.

LAXITY PROFILE RANKING

The laxity profile ranking is based on the hip with the greater laxity (DI). This interpretation is based on a cross-section of 527 CANINE animals of the VIZSLA breed. The median DI for this group is 0.40.

Percentiles

configuration, meaning tighter hip by breed shifts; the average laxity and range of laxity for a particular breed will change over time.
